

Array Methods (map) Exercise

Hello, future software developer! In this exercise, you will practice an array method:

`filter` . 🤖

You are provided with an array of users where each user has `firstName` , `lastName` , and `points` .

Your task is to iterate over this array using the `map` method and return a new array with new properties `fullName` and `membershipStatus` , where `fullName` is a combination of `firstName` and `lastName` , and `membershipStatus` is `Premium` if the user's points are more than 100, and `Standard` otherwise. Print the new array.
